

Population in census tracts for which the 1999 median exposure exceeded a noncancer hazard quotient (or hazard index) of 1.0 (based on all sources combined).

Results are based on inhalation exposure to outdoor sources only. Although these results assume continuous exposure to 1999 levels of air toxics over a lifetime, current and planned control programs are expected to substantially reduce these exposures and associated cancer risk for some pollutants. Please see additional information about additional limitations on the following page.
